

Yes. Here is the **complete Office Cleaning logic**, brought together in a way that can be handed to the developer and understood without needing the previous conversation.

CleanScape — Office Cleaning Booking & Pricing Logic

1. Purpose

Office Cleaning sits under:

Commercial Cleaning → Office Cleaning

The objective is simple:

The customer tells CleanScape what spaces they have and how thoroughly they want them cleaned. CleanScape calculates how much cleaning work is required, determines the number of cleaners needed, and then calculates the price.

The customer **does not calculate hours themselves**.

2. The Basic Logic

Every calculation starts by asking:

What spaces are being cleaned?

Then:

How many of each space?

Then:

How large is each space?

Then:

What cleaning level is required?

The system converts those answers into **cleaner-hours**.

Important rule

All cleaning times are initially calculated as though **ONE cleaner** is doing the entire job.

For example:

8 cleaner-hours = the amount of work that would take one cleaner approximately 8 hours.

It does **not** mean we will actually send one cleaner for 8 hours.

3. Customer Selects Commercial Cleaning

Customer clicks:

Commercial Cleaning

They are shown:

What type of premises needs cleaning?

Office Cleaning
Retail & Hospitality Cleaning
Educational Facility Cleaning
Communal Area Cleaning
Airbnb / Short-Let / Serviced Accommodation

Customer selects:

Office Cleaning

4. Select Cleaning Level

The customer chooses one cleaning level.

Essential

Routine cleaning and general maintenance.

Enhanced

More detailed cleaning, with additional attention to surfaces and high-use areas.

Comprehensive

Intensive top-to-bottom cleaning.

These levels affect **how much time CleanScape allocates to every space.**

5. Tell Us About Your Office

The customer is shown the main office spaces:

Office / Work Areas

Meeting / Conference Rooms

Toilets / Washrooms

Kitchen / Break Rooms

Reception / Waiting Areas

Corridors / Common Areas

And:

+ Add Another Space

This allows the customer to tell us about a space that isn't listed.

6. Customer Enters Quantity

For each space:

How many do you have?

Example:

Office/work areas → **3**

Meeting rooms → **2**

Toilets → **2**

Kitchen → **1**

Reception → 1

Corridor/common area → 1

7. Customer Selects Size

For each space, they select:

Small

Medium

Large

Not Sure

We show the approximate measurements beside the options so customers who know their size can make an accurate selection.

Customers who don't know simply choose **Not Sure**.

8. Office Cleaning Time Matrix

Every time below represents ONE cleaner.

Space	Size	Essenti al	Enhance d	Comprehensiv e
Office / Work Area	Small ≤25m ²	10 min	15 min	25 min
	Medium 26–60m ²	20 min	30 min	45 min
	Large 61–100m ²	30 min	45 min	65 min
	Not Sure	25 min	40 min	55 min
Meeting / Conference Room	Small ≤15m ²	10 min	15 min	20 min
	Medium 16–30m ²	15 min	20 min	30 min

	Large 31–50m ²	20 min	30 min	40 min
	Not Sure	20 min	25 min	35 min
Toilet / Washroom	Small ≤10m ²	15 min	20 min	30 min
	Medium 11–20m ²	20 min	30 min	40 min
	Large 21–35m ²	30 min	40 min	55 min
	Not Sure	25 min	35 min	50 min
Kitchen / Break Room	Small ≤10m ²	15 min	25 min	35 min
	Medium 11–25m ²	25 min	35 min	50 min
	Large 26–40m ²	35 min	50 min	70 min
	Not Sure	30 min	45 min	60 min
Reception / Waiting Area	Small ≤15m ²	10 min	15 min	25 min
	Medium 16–35m ²	15 min	25 min	35 min
	Large 36–60m ²	25 min	35 min	50 min
	Not Sure	20 min	30 min	45 min
Corridor / Common Area	Small ≤25m ²	10 min	15 min	20 min
	Medium 26–60m ²	15 min	25 min	35 min
	Large 61–100m ²	25 min	35 min	50 min
	Not Sure	20 min	30 min	45 min

9. How "Not Sure" Works

The customer should never be forced to measure their office.

If they select:

Not Sure

CleanScape automatically uses the average of the **Medium and Large cleaning times**, rounded up to the nearest 5 minutes.

Example:

Medium Enhanced Office = **30 minutes**

Large Enhanced Office = **45 minutes**

Average = **37.5 minutes**

CleanScape rounds this to:

40 minutes

This calculation happens in the background.

The customer simply sees:

Not sure? That's okay — we'll estimate it for you.

10. How Cleaner-Hours Are Calculated

The calculation is:

Quantity × Time for Selected Size & Cleaning Level

Then all spaces are added together.

Example

Customer selects **Enhanced Office Cleaning**.

They have:

Space	Selection	Calculation	Time
Office areas	3 × Medium	3 × 30 min	90 min
Meeting rooms	2 × Small	2 × 15 min	30 min
Toilets	2 × Small	2 × 20 min	40 min
Kitchen	1 × Medium	1 × 35 min	35 min
Reception	1 × Small	1 × 15 min	15 min
Corridor	1 × Medium	1 × 25 min	25 min
TOTAL			235 min

235 minutes ÷ 60 =

3 hours 55 minutes of cleaner-time.

For operational simplicity, we can eventually decide whether customer-facing quotations round this to the nearest pricing interval.

11. Automatic Cleaner Allocation

This happens **after** the total cleaner-hours have been calculated.

CleanScape's rule:

A single cleaner should not be allocated more than 5 hours on one cleaning job.

Therefore:

Up to 5 cleaner-hours

1 cleaner

More than 5 cleaner-hours

The system automatically adds cleaners.

Cleaning Requirement	Cleaner s	Approx. Duration
1–5 hrs	1	1–5 hrs
6 hrs	2	3 hrs each
8 hrs	2	4 hrs each
10 hrs	2	5 hrs each
11 hrs	3	3 hrs 40 min each
12 hrs	3	4 hrs each
15 hrs	3	5 hrs each
16 hrs	4	4 hrs each
20 hrs	4	5 hrs each

The developer logic is:

Required Cleaners = Total Cleaner-Hours ÷ 5, rounded UP to the next whole cleaner.

Then:

Estimated Job Duration = Total Cleaner-Hours ÷ Number of Cleaners

12. Very Important: Cleaner Allocation Does NOT Reduce the Billable Hours

Suppose the office requires:

8 cleaner-hours.

CleanScape automatically assigns:

2 cleaners × 4 hours.

The physical job may therefore take approximately **4 hours**.

But the customer is still purchasing:

8 cleaner-hours.

We **do not** calculate the price using the 4-hour elapsed duration.

This distinction needs to be very clear in the backend.

13. Additional Booking Information

Once the cleaning requirement has been calculated, collect:

Cleaning frequency

One-off

Weekly

Fortnightly

Other

Then:

Preferred date

Preferred start time

Access instructions

Specific requirements / notes

Then any applicable:

Add-ons

14. Pricing Engine

Once we establish the final CleanScape commercial hourly rates, pricing becomes straightforward:

$$\text{Total Cleaner-Hours} \times \text{Applicable Rate} + \text{Add-ons} = \text{Customer Price}$$

Example only:

If the system calculates **8 cleaner-hours**, pricing is based on **8 hours**, regardless of whether CleanScape sends one, two or more cleaners.
